产品简介

Product introduction

■ 钛酸锂材料的特性

钛酸锂材料属尖晶石结构，其最大特点是充放电体积变化非常小，称之为“零应变”材料。这种“零应变”性能避免了石墨层反复膨胀收缩造成的结构破坏，提高了电池的使用寿命和安全性能，同时具有优异的高倍率特性和低温特性；钛酸锂负极表面不易生成SEI膜，脱嵌电位高（约1.55V），无金属锂析出导致的安全事故风险。

相比传统的三元和磷酸铁锂材料，钛酸锂电池在安全性、循环寿命和低温性能方面具有突出的优势，其电池产品可广泛应用于各类储能领域及高功率动力领域。

■ 三元、磷酸铁锂材料的特性

镍钴锰三元和磷酸铁锂是目前市场应用较广的电池正极材料，三元材料突出的优点是比能量高，其电池产品更加适用于对体积小、重量轻等能量密度要求高的电动自行车、电动汽车等动力领域，但须进一步提升其安全性能；磷酸铁锂材料突出的优点是高温性能及循环性能较好，其电池产品可适用于电动大巴等动力领域及各类储能领域，但同时具有低温性能较差的不足。

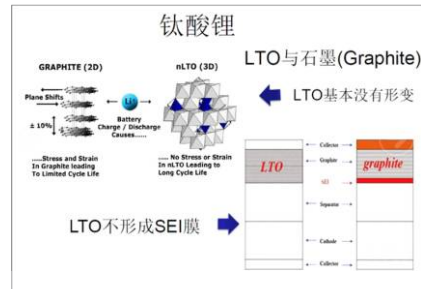

现有的三元、磷酸铁锂电池采用石墨作负极，在充放电过程中易形成SEI膜，锂离子插层造成石墨体积膨胀效应，易导致石墨层状结构坍塌，这种坍塌造成金属锂沉积形成锂枝晶，锂枝晶会刺破隔膜造成电池内部短路，从而引起起火爆炸。

Characteristics of LTO materials

The LTO material belongs to spinel structure, the charge/discharge volume changed is very small, called "zero strain" material. This "zero strain" performance can avoid structural damage caused by repeated expansion and contraction of the graphite layer, and improve the service life and the safety performance of the battery, also has excellent high C-rates and low temperature characteristics. The SEI film is difficult to generate on the surface of LTO negative, with a high deintercalation electric potential (about 1.55V), without safety accident risk lead by metal lithium precipitation.

Compared with traditional materials of NMC and LFP, the LTO battery has the outstanding advantages in safety, cycle life and low temperature performance, its battery products can be widely used in many kinds of energy storage fields and high power fields.

Characteristics of NMC and LFP materials

The NMC and LFP materials are the normal positive materials widely used in markets, the outstanding advantage of NMC material is high energy rate, its battery products are more suitable for E-bike, EV etc power fields which require small volume and low weight, but need to further enhance the safety; The outstanding advantages of LFP material are better low temperature and cycle life, its battery products can be used in E-bus etc power fields and many energy storage fields, but need to improve the low temperature performance.

The existing NMC and LFP battery are use Graphite as negative material, and the SEI film is easy to generate in charging/discharging process, Lithium ion intercalation will results in graphite volume expansion and easy to lead to collapse of graphite layered structure, and this collapse result in the formation of metallic lithium deposits and form lithium dendrites, Lithium dendrites will pierce the separator and will lead to internal short circuit of the battery, causing a fire or explosion.
